

PRODUCT DATA SHEET

Wheel & Trim Transportation Coating / OH-219

Features: Vehicle Transportation and Storage Coating is a water-based mixture of wetting agents and a synergistically blended mixture of amine surfactants. The coating dries quickly to form a barrier on metal and chrome surfaces such as wheels and other exposed surfaces. It is a non-staining synthetic product that contains no oils, nitrates or solvents and can effectively prevent corrosion and the growth of fungi and mold.

Uses: Use for protection of non-painted surfaces during transportation and storage of vehicles. Effective as an anti-corrosive for wheels and chrome. Not known to be harmful to any vehicle components or surfaces.

Directions:

Installation: Stir or shake well before use. Apply with conventional spray equipment to the desired pattern. A thin coating is sufficient. For best and most economical results, apply to dry surfaces. Do not apply to hot surfaces or in direct sunlight.

Removal: To remove coating spray with high pressure water. Agitate with soft bristle brush if necessary. If the coating has been applied particularly heavily or if it has been allowed to remain on the surface for a long period of time it may be necessary to wash with soapy water and then rinse.
